

Post Construction Site Cleaning

Preventing Business Disruption & Financial Loss

If you've recently expanded or built a new data center then call ProSource to make sure before you install new equipment your data center is clean to industry standards. A Post Construction cleaning not only helps prevent contamination risks that can cause downtime, but helps improve efficiency and reliability of hardware. Contamination accumulates inside server cabinets and hardware over time through airflow that carries particulate from your facility. Take every precaution to prevent downtime by removing contamination with our post construction cleaning service.

ProSource provides specialized cleaning services and related products to data center facilities to help prevent the high cost of equipment related business interruptions caused by contamination build-up inside data centers. The cost of downtime is significant and should be prevented. Our solution has a minimal investment with a high return of cost avoidance, and is an industry recommended best practice.
