

## Subfloor Encapsulation

### Preventing Business Disruption & Financial Loss

The concrete subfloor beneath the raised floor is one of the largest source of dust and contamination inside your data center. Subfloor encapsulation not only helps prevent contamination risks that can cause downtime, but helps improve efficiency and reliability of hardware by encapsulating concrete dust. Contamination accumulates inside server cabinets and hardware over time through airflow that carries particulate from your facility. Take every precaution to prevent downtime by preventing contamination with our Subfloor Encapsulation service.

ProSource provides specialized cleaning services and related products to data center facilities to help prevent the high cost of equipment related business interruptions caused by contamination build-up inside data centers. The cost of downtime is significant and should be prevented. Our solution has a minimal investment with a high return of cost avoidance, and is an industry recommended best practice.

#### Available Services:

- *Daily general cleaning*
- *Subfloor surface cleaning*
- *Raised floor surface cleaning*
- *Exterior equipment surface cleaning*
