

Data Center Airflow Management

Improve airflow & save money with airflow management

Servers require a sufficient amount of cooling to function correctly. Although most data centers provide more than enough cooling, it often bypasses servers. Managing data center airflow will maximize existing cooling capacity and avoid heat-related issues.

- **Floor grommets**
seal airflow in cable cutouts
- **Blanking panels**
seal airflow in cabinets
- **Directional airflow panels**
improve server capture rates
- **Airflow dampers**
manage cooling demand
- **Containment systems**
Seal airflow in aisles

Benefits of managing your data center's airflow

- Reduces wasted cooling and heat-related problems
- Improves efficiency of the existing cooling system
- Avoids the cost of adding new cooling capacity
